

IDEATION PHASE — BRAINSTORM & IDEA PRIORITIZATION

Date	30June 2026
Team ID	23A51A4211
Project Name	Visitor Management System
Maximum Marks	4 Marks

Problem Identification

 Traditional	 Manual	 Cons
- Traditional workplace visitor tracking relies heavily on manual paper logbooks at reception. - Causes slow check-in speeds and unorganized record keeping.	Manual validation and recording of host and visitor credentials increases wait times during peak morning rush hours.	- Physical visitor sheets are insecure, easily damaged, or misplaced. - Lacks an instant digital mechanism to automatically notify internal hosts.

Brainstorming Ideas

Idea - 1 Scoped Custom Application architecture to contain security and assets efficiently.	Idea - 2 Structured database schema matching visitor profiles, company metrics, and visit logs.	Idea - 3 Automated operational lifecycle status tracking (Pending, Checked In, Completed).
Idea - 4 Front-end 10-digit phone validation via regular expressions inside a Client Script.	Idea - 5 Real-time database-driven transactional email notifications to alert Security teams.	Idea - 6 One-click server-side state transition button using custom UI Actions on target records.

Key Objectives

- **Minimize Wait Times:** Streamline the arrival-to-entry process down to a few automated seconds.
- **Enforce Quality Validation:** Maintain pristine platform records by filtering invalid inputs before transactional database commit.
- **Optimize Internal Operations:** Remove absolute dependencies on standard phone outreach by leveraging platform event triggers.
- **Digitize Governance Logs:** Establish comprehensive audit footprint mapping modern compliance metrics flawlessly.
