

Project Design Phase
Proposed Solution Template

Date	30-06-2026
Team ID	23A51A4211
Project Name	Visitor Management System
Maximum Marks	2 Marks

Proposed Solution :

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Traditional enterprise visitor tracking relies on paper-bound clipboard logs, manual phone coordination, and physical desk check-ins, causing high bottleneck lines at lobby reception desks during peak hours, increasing input data errors, and limiting real-time facility visibility. The project aims to centralize, digitize, and automate the visitor entry log pipeline.
2.	Idea / Solution description	Develop a centralized cloud-based Visitor Management System built entirely on the ServiceNow platform. The application provides an intuitive self-service portal or Service Catalog form where employee hosts can pre-register guests, perform automatic data field string validation formatting checks via client-side scripting, map dynamic check-in log states instantly with interactive desk UI Actions, and dispatch automated notification confirmation alerts paired with scannable virtual QR visitor pass badges.
3.	Novelty / Uniqueness	The application unifies advanced Service Catalog configuration models, dynamic multi-field data validations, instant state machinery via custom UI Actions, transactional email notifications, and live operational analytical dashboards into a single scoped cloud application context inside the ServiceNow environment to achieve an end-to-end audit log footprint.
4.	Social Impact / Customer Satisfaction	Reduces visitor waiting time queues at physical building entry points, promotes contactless virtual badge validation methods, increases daily workplace security, optimizes coordination workflows between guards and hosts, and elevates the overall workplace entry check-in experience for enterprise visitors.
5.	Business Model (Value Model)	Value and return are measured through significant reductions in security processing overhead, increased front-desk operational efficiency, and minimized corporate risk profiles. The platform architecture seamlessly supports premium facility access additions, vendor tier badge plans, third-party integrated security

		checkpoint data loops, and localized office space optimization extensions.
6.	Scalability of the Solution	The architecture leverages ServiceNow's cloud infrastructure to effortlessly scale to manage thousands of concurrent active log rows, diverse site facilities, complex custom Access Control Lists (ACLs), and future platform enhancements like hardware kiosk integrations, biometric validation setups, and workplace indoor wayfinding maps.
