

Project Design Phase Solution Architecture

Date	30-06-2026
Team ID	23A51A4211
Project Name	Visitor management system
Maximum Marks	4 Marks

Solution Architecture:

The Visitor Management System is engineered on the ServiceNow enterprise platform utilizing a highly structured, decoupled, and secure three-tier application architecture. This setup ensures seamless transaction isolation, precise security control via system roles, and immediate data persistence parsing across custom scoped tables:

User Interaction Layer (Service Portal / Kiosk UI): Provides an intuitive self-service portal layout or front-desk lobby kiosk context. Employee hosts configure visitor names, target email profiles, phone records, and scheduled meeting dates via native Catalog Items.

Business Logic Layer (Client & Server Engines): Coordinates incoming operations via Catalog Client Scripts, Client-callable Script Includes, and asynchronous GlideAjax calls. This engine handles input evaluation rules (e.g., telephone string validation patterns) and executes interactive state updates via UI Actions.

Data & Integration Service Layer (Cloud Schema & Assets): Manages record persistence across custom application tables (such as x_snc_visitor_log). This layer controls security filters via Access Control Lists (ACLs), triggers transactional email alerts, embeds virtual QR code validation assets, and tracks live security metrics using graphical workspace dashboards.
